Yet Another Flight Controller (YAFC) is a project being held within the Computer Science Master at Université Paul Sabatier.

Zhenyu Bai expressed their interest in drones. In particular for drones :

- that are cheap to produce ;
- physically basic ;
- easily configurable.

The project thus aims to provide a fonctionnal drone that complies with the aforementioned critierias.

While the Flight Controller (FC) is the piece of software that controls the different physical components of the drone itself, the autopilot is what autonomously controls what the drone does.

Today, completely fonctionnal and ready-to-use drones are expensive. But it is technically possible to produce cheap drones using or inspired by PixHawks.
